

# Python Basics NoteBook

```
In [ ]: #Write a Python code to return your Python version
```

```
In [ ]: #Write a Python code to declare variable id="513".  
#Print the following statement "customer id =513". [Don't use print("customer id
```

```
In [ ]: #Run the following statement, why there is an error
```

```
id=id+1
```

```
In [ ]: #Convert the variable id into an integer, increment it by 1.  
#Assign the result to variable new_id.  
#Print the new_id
```

```
In [ ]: #Write a Python code to print the following string in a specific format (see the
```

```
# Twinkle, twinkle, little star,  
#     How I wonder what you are!  
#         Up above the world so high,  
#             Like a diamond in the sky.
```

```
In [ ]: #Givin the following string variable, # Print the first element in the string
```

```
course="Python for Data Science"
```

```
In [ ]: # Print the element on the 13th index in the string
```

```
In [ ]: # Find the Length of string
```

```
In [ ]: # Print the Last element in the string [use negative index]
```

```
In [ ]: # Take the slice on variable course with only index 11 to index 14
```

```
In [ ]: # Get every third element in the range from index 0 to index 20
```

```
In [ ]: # Concatenate course string with ", AI & Development"
```

```
In [ ]: # Replace all the spaces with (_). New string should looks Like"Python_for_Data_S
```

```
In [ ]: # Convert all the characters in string to upper case
```
